FOUR EMOCRIMOL. 121120-110/0021.

TECOPTORIS NUCLEAR FOR TABBOTION THAT directly binds n receptors and stimulates the transcriptional activities in a hormone-dependent fashion. Coactivates expression in an agon and ARZ-dependent manner. Involved in the coactivation of different muclear receptors, such as for steroids (RR and ER retinoids (RARs and RKRs). Probably functions as a general and prostanoids (PRRs). Probably functions as a general coactivator. rather than just a nuclear receptor coactivator also be involved in the coactivation of the NF-kappa-B pathw May coactivate expression via a remodeling of chromatin and interaction with histone acetyltransferase proteins.

Interaction with histone acetyltransferase proteins. Similarity). Interacts in vitro with the basal transcription factors GTF2A and TBP, suggesting an autonomous transactivat function. Interacts with NCOAI, CRSP3, RBM14, the histone acetyltransferases BD300 and CREBBP, and with the acetyltransferases BD300 and CREBBP, and with the histone acetyltransferases BD300 and CREBBP, and with the histone retinoblastoma-binding protein RBC-2/NCOA6, the retinoblastoma-binding protein RBC-3/RBBPS, and ML13, and cutting the trithorax group proteins ML2 and ML13, and

J. Biol. Chem. 277:1229-1234(2002).

-!- FUNCTION: Nuclear receptor coactivator that directly binds nu receptors and stimulates the transcriptional activities in a hormone-dependent fashion. Coactivates expression in an agoni and ARZ-dependent manner. Involved in the coactivation of different nuclear receptors, such as for steroids (GR and ERS retinoids (RARS and RKRS), thyroid hormone (TRS), vitamin D3 and prostanoids (PPARS). Probably functions as a general coactivator, rather than just a nuclear receptor coactivator.

also be involved in the coactivation of the NP-kappa-B pathwas the part of activate expression via a remodeling of chromatin and interaction with histone acetyltransferase proteins. Involved placental, cardiac, hepatic and embryonic development.

-!- SUBUNIT: Monomer and homodimer. Interacts in vitro with the britanscription factors GTF2A and TBP, suggesting an autonomous transcription function. Interacts with NROAM, CREBBP, and with histone acetyltransferase proteins RBOO and CREBBP, and with methyltransferase proteins NCOAGIP and HRWIILI (By similarity interacts with RMPC2. Belongs to the ASC-Z/NKOAG complex constitution factors and the ASC-Z/NKOAG complex constitutions and constitutions and activity the statical and activity a

                                                                                                                                                                     uterus. High expression in neural tube and in CNS ut development. High expression in sensory ganglia and com Ell. In the alimentary tract and olfactory epithelium on was seen from Ell. Strong expression present in liver by, from Ell and El3 respectively, and then expression is at later stages of development. Moderate expression in El3, while it decreases during postnatal life. Strong on in thymus from El5 onwards, and in spleen from El7 and irly postnatal life, then, the expression decreases. Contains two Leu-Xaa-Xaa-Leu-Leu (LXXLL) motifs. Only is sesential for the association with nuclear receptors. Sphorylated (By similarity).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      57; C:transcripton factor complex; IDA.

J. Biochem. 168:629-633(1987).
-!- FUNCTION: Antifreeze proteins lower the blood freezing point.
-!- SIMILARITY: BELONGS TO THE TYPE-I AFP FAMILY. TYPE 1 AFP ARE
ALANINE-RICH, AMPHIPHILIC AND ALPHA-HELICAL.
                                                                                                                                                                                                                                                                                                                                      This SWISS-PROT entry is copyright. Strobel O., Koepke A.K.E., Kamp R.M., Boeck A., Wittmann-Liebold Strobel O., Koepke A.K.E., Kamp R.M., Boeck A., Wittmann-Liebold In Primary structure of the archaebacterial Methanococcus vannielli ribosomal protein 112. Amino acid sequence determination, oligonucleotide hybridization, and sequencing of the gene."; J. Biol. Chem. 263:6538-6546(1988).

-!- FUNCTION: Seems to be the binding site for several of the factinguised involved in protein synthesis and appears to be essential for accurate translation (By shinlarity).

-!- SIMILARITY: Belongs to the L12P family of ribosomal proteins.
                                                                                                                                                                                                                                                             This SWISS-PROT entry is copyright. The complete genome sequence of the hyperthermophilic, sulphate
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           reducing archaeon Archaeoglobus fulgidus.";
Nature 390:364-370(1997).
-!- FUNCTION: Seems to be the binding site for several of the faction of the protein synthesis and appears to be essential for accurate translation (By similarity).
-!- SIMILARITY: Belongs to the L12P family of ribosomal proteins
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         This SWISS-PROT entry is copyright. Byrard J.-L., Jako C., Saint-Guily A., Weil J.H., Kuntz M.;

By and values of proline-rich proteins in sunflower.";

Plant Mol. Biol. 16:271-281(1991)

-!- FUNCTION: Anther-specific cell wall protein which could cont to the cell wall architecture of epidermal anther cells via intermolecular disulfide bridges.

-!- TISSUE SPECIFICITY: Epidermal anther cells.

-!- DEVELOPMENTAL STAGE: Late developmental stages.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              . .)                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       in)
```

```
of SRP9 and SRP14 is required for SRP RNA binding.
-!- SUBUNIT: Signal recognition particle consists of a 7S RNA molof 300 nucleotides and six protein subunits: SRP72, SRP68, SI SRP19, SRP4 and SRP9.
-!- SUBCELLULAR LOCATION: Cytoplasmic.
-!- SIMILARITY: Belongs to the SRP14 family.
                                                                                                                                                                                                                     This SWISS-PROT entry is copyright. -!- CATALYTIC ACTIVITY: Two-stage endonucleolytic cleavage to nucleoside 3'-phosphates and 3'-phosphooligonucleotides endin G-P with 2', 3'-cyclic phosphate intermediates.
-!- SUBCELDULAR LOCATION: Secreted.
-!- SIMILARITY: Belongs to the ribonuclease NI/T1 family.
-!- CAUTION: Ref.1 sequence differs from that shown due to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               10-OCT-2003 (Rel. 42, Created)

AR LOCATION: Nuclear (Potential).
f: Belongs to the HMG1/HMG2 protein family.
f: Contains 1 HMG box domain.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        0; Indels

Mech. Dev. 80:77-86(1999).
-!- FUNCTION: May bind RNA.
-!- FUNCTION: May bind RNA.
-!- TISSUE SPECIFICITY: Expressed in developing heart.
-!- DEVELOPMENTAL STAGE: mRNA already detected at stage 7-8 in tl
cardiogenic mesoderm, and become almost undetectable in the
curvature of the ventricular region whereas remaining high in
developing atrial regions.
-!- SIMILARITY: Contains 1 RNA recognition motif (RRM) domain.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 This SWISS-PROT entry is copyright.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               -i- FUNCTION: Binds preferentially single-stranded DNA and unwing double stranded DNA (By similarity).
-i- SUBCELULIAR LOCATION: Nuclear (By similarity).
-i- SIMILARITY: Belongs to the HWG1/HWG2 protein family.
-i- SIMILARITY: Contains 2 HWG box domains.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    the Buropean Bioinformatics Institute.                                                                                                                                                                                                                                                                                                                                                                           Part of the 30S ribosomal subunit. Contacts proteins S4 (similarity).

*N-terminal domain interacts with the head of the 30S is C-terminal domain interacts with the body and protein S4. The interaction surface between S4 and S5 is contains 1 S5 DRBM domain.

(*Contains 1 S5 DRBM domain.

(*Belongs to the S5P family of ribosomal proteins.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Gaps

Protein phosphatase 1, regulatory subunit 3D (Protein phosphatas regulatory subunit 6) (Protein phosphatase 1 ppp.Rey.
 Nature 414:865-871(2001).

-!- FUNCTION: Protein phosphatase 1 regulatory subunit is consid as a glycogen-targeting subunit. PP1 is essential for cell division, and participates in the regulation of glycogen metabolism, muscle contractility and protein synthesis.

-!- SUBUNIT: Interacts with PPPICC catalytic subunit of PP1, and
 Armstrong C.G., Browne G.J., Cohen P., Cohen P.T.W.; "PPPRA, a novel member of the family of glycogen-targetting subof protein phosphatasel."; FEBS Lett. 418:210-214(1998).
 SEQUENCE FROM N.A., ASSOCIATION WITH GLYCOGEN, AND INTERACTION W
 expression in skeletal muscle and heart.

DOMAIN: CBM_21 domain is known to be involved in the localiz to glycogen and is characteristic of some regulatory subunit
 Eukaryota; Metazoa; Chordata; Craniata; Vertebrata; Euteleostomi
Mammalia; Eutheria; Primates; Catarrhini; Hominidae; Homo.
 "The DNA sequence and comparative analysis of human chromosome 2
 associates with glycogen.
-!- TISSUE SPECIFICITY: Expressed in all tissue tested. High
 phosphatase complexes.
SIMILARITY: Contains 1 CBM_21 domain.

 Sex determination switch protein which controls sexual to be sex specific splicing. Regulates dosage on in females by suppressing hyperactivation of X-linked ression of the embryo-specific isoform is under the primary sex-determining signal, which depends on the chromosomes relative to autosomes (X:A ratio).

I cocurs in X:As calls, but not in X:As calls. The X:A is to be signaled by the relative concentration of the X-unscription factors SIS-A and SIS-B. As a result, the ciffic product is expressed early only in female embryos ites female-adult specific splicing; in the male where it ressed, the default splicing gives rise to a truncated stall protein. The female-specific isoform specifics the structury feedback loop leading to female development the female-specific isoform controls the sex-specific fit transformer (TRA); acts as a translational repressor specific lethal-2 (MSL-2) and prevents male-less (MLE), MSL-3 proteins from associating with the female X

Plays a significant role in the specification and nesis of the sensory retina. May also participate in the ner of the cells of the inner nuclear layer, particularly cells of the inner nuclear layer, particularly cells (By similarity).

AR LOCATION: Nuclear (By similarity).

SECTIFICITY: Retina and spinal cord.

SNTAL STAGE: Expressed throughout the invaginating optic at stage 12, and uniformly throughout the neural retina cells.

ige 20.
IY: Belongs to the paired homeobox family.
IY: Contains 1 CVC domain.
IY: Contains 1 homeobox domain.
IY: Contains 1 OAR domain.
